RESEARCH STATEMENT

I direct the Human Dynamics and Controls Laboratory (HDCL) in the Department of Mechanical Science and Engineering. Our research group uses methods from design, control theory, mechatronics, pneumatics and soft robotics, musculoskeletal biomechanics, and movement analysis. The HDCL focuses on investigating and improving movement control and function through two main areas: assistive device development and locomotion biomechanics. The HDCL's interest in assistive device development stems from a desire to improve function and the quality of life of persons with disability. In 2021-2022, we are addressing the following research projects: (i) Lean-to-steer, self-balancing and omnidirectional ballbot wheelchair; (ii) medical education task trainers to simulate: abnormal neuromuscular conditions observed during neurological examination procedures, or the right atrium during transseptal cardiac surgery; (iii) wearable devices and machine learning for anxiety detection; (iv) pneumatic inflatables for next generation bed mattresses or wearable intervention devices; and (v) pectin-graphene based ultrasensitive temperature sensors.
